

Week3

Packages

- Everything so far has been using Base R, which are the default packages that open when RStudio loads
- Packages, aka libraries or modules
- Collection of functions or datasets
- CRAN has the 'official' packages for R
- Environment Tab -> Global environment shows packages loaded
- First time using a package on a computer you must install it using `install.packages()`. Can browse on Packages Tab

```
# install.packages("dplyr") # Only needs to be done once
```

- Then you load the package using `library()`, which must be done each session

```
# library("dplyr")
```

- To list everything in a package use `ls()`:

```
# ls("package:dplyr")
```

- To ensure a function is used from a specific package (in the case the function name exists in multiple packages), use `::`

```
# dplyr::filter(iris, Species == "virginica")
```

-
